**Team Names**: Sampurna Basu, Sagar Punhani, Kevin Wang, Matt Wenner
**Product Name**: Entree
**Product Summary:** Social recipe web app aimed at college students.

Entree is a standalone web application and will be deployed as such with three major tenets being initiated in succession.  First, the tester must deploy the SQL Server by launching FinalProject.sql on their SQL Workbench.  Then, the tester must then run main.java which in turn instantiates the various class files.  Lastly, the tester must deploy the JFXBrowser in BrowserMain.java which launches a browser driven java app incorporating our html, css, and javascript code.  The user can then navigate our application as they would a normal web browser to use the various features.  All the files mentioned above can be downloaded as a zip file in our BitBucket repo.
